Subject: SWMU Assessment Report (SAR)
MACS 6 Battery Service Room Leach Field
MCAS-Cherry Point, NC

Dear Bill:

The North Carolina Superfund Section has reviewed the subject document. Because the groundwater flow direction in the vicinity of this site may be somewhat in the eastern direction, an additional groundwater sampling point is necessary to evaluate the potential release from the drainfield, septic tank and associated lines to the MACS 6 battery service room. Attached is a map indicating the approximate location of an additional sampling point. (Note: Several maps reviewed for this area label this building either 4318 or 3265. Which is correct?) Analyses for this additional groundwater sample should be the same as that of the previous three samples collected (TCL volatile and semivolatile organic compounds, pesticides, PCBs, TAL metals plus cyanide).

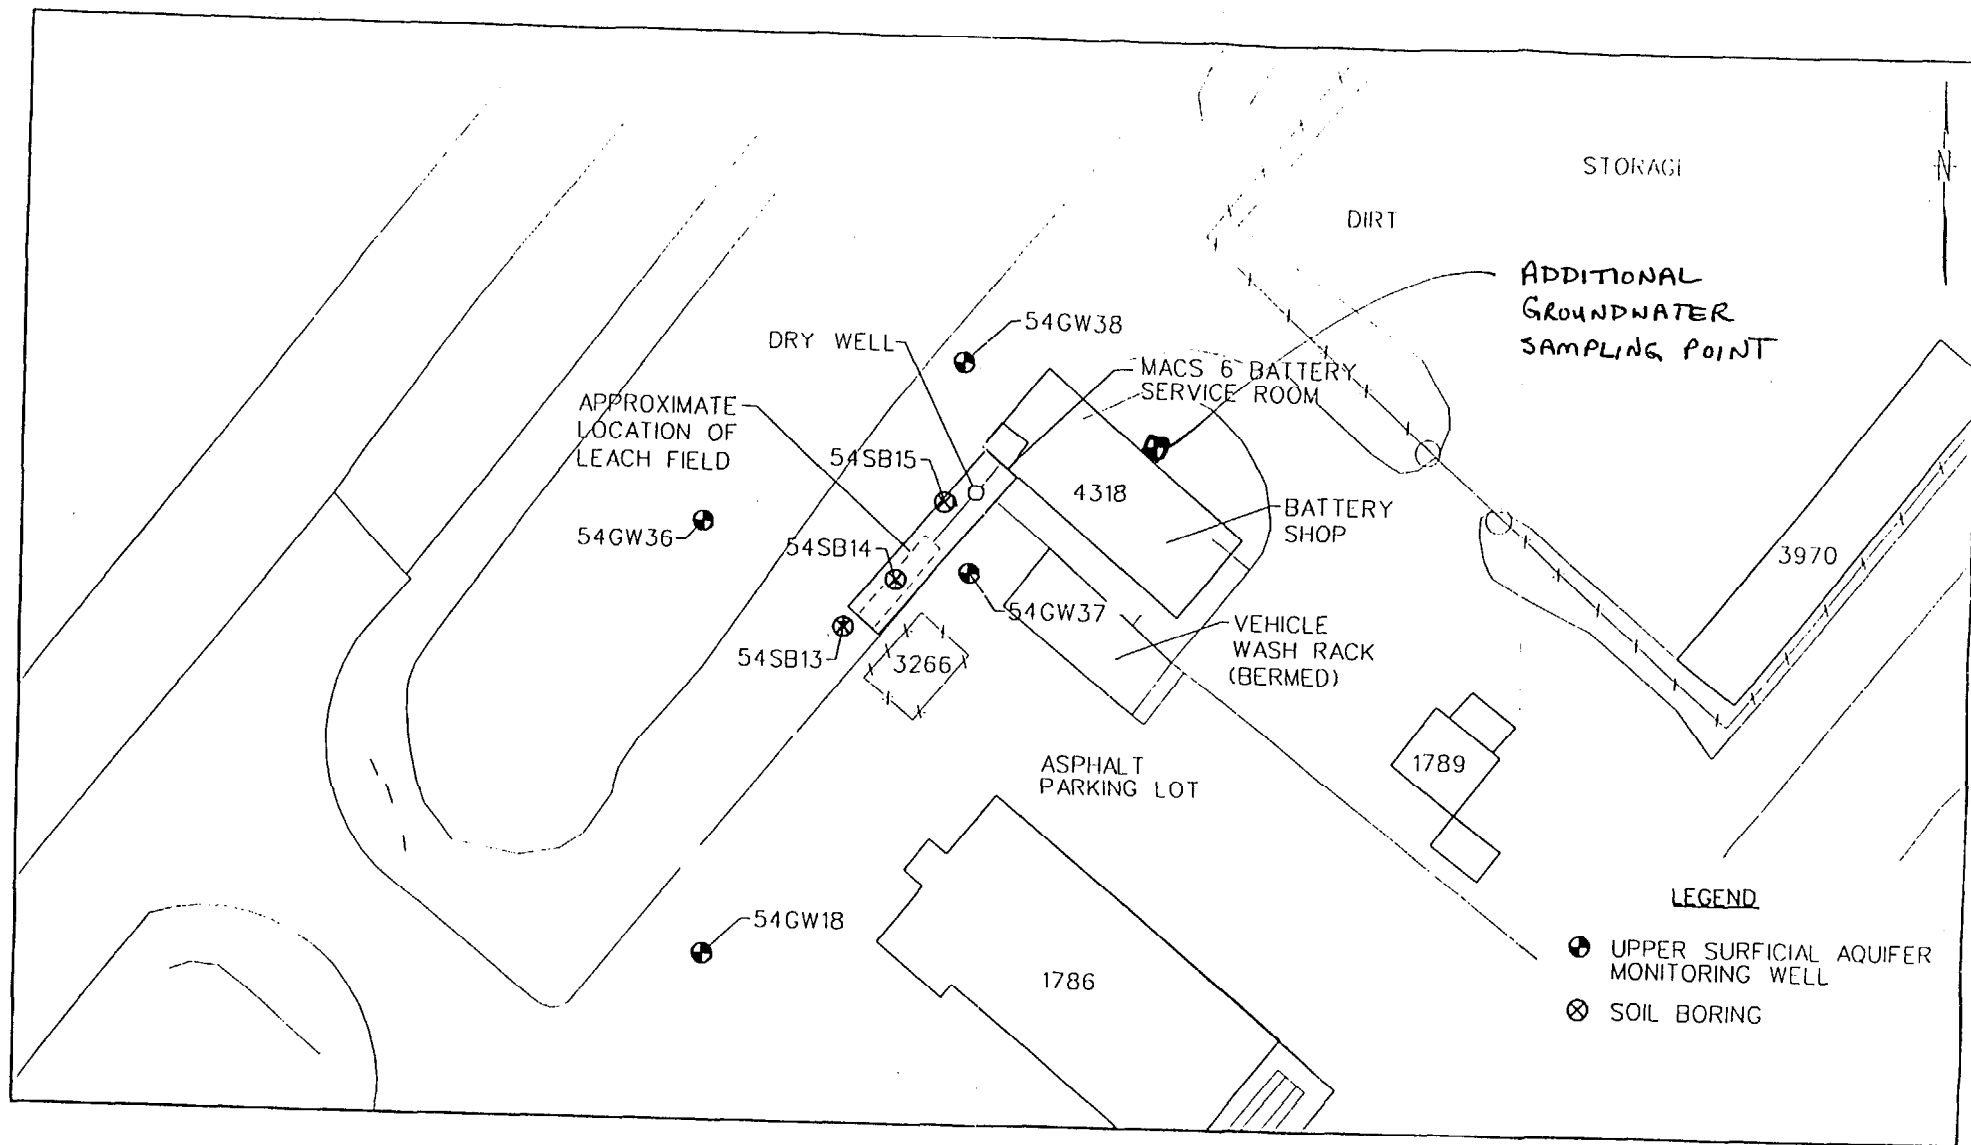

If you have any questions, please do not hesitate to contact me at (919) 733-2801, extension 340.

Sincerely,

Linda F. Raynor
